React

What is React ?

- → It is JS library for the use of development of Frontend UI / appln.
- → Not a framework
- → Angular / vite (Framework) Other framework
- → 2013 developed a react by Facebook (Now meta) for their complex frontend problem or appln
- → Component based design architecture

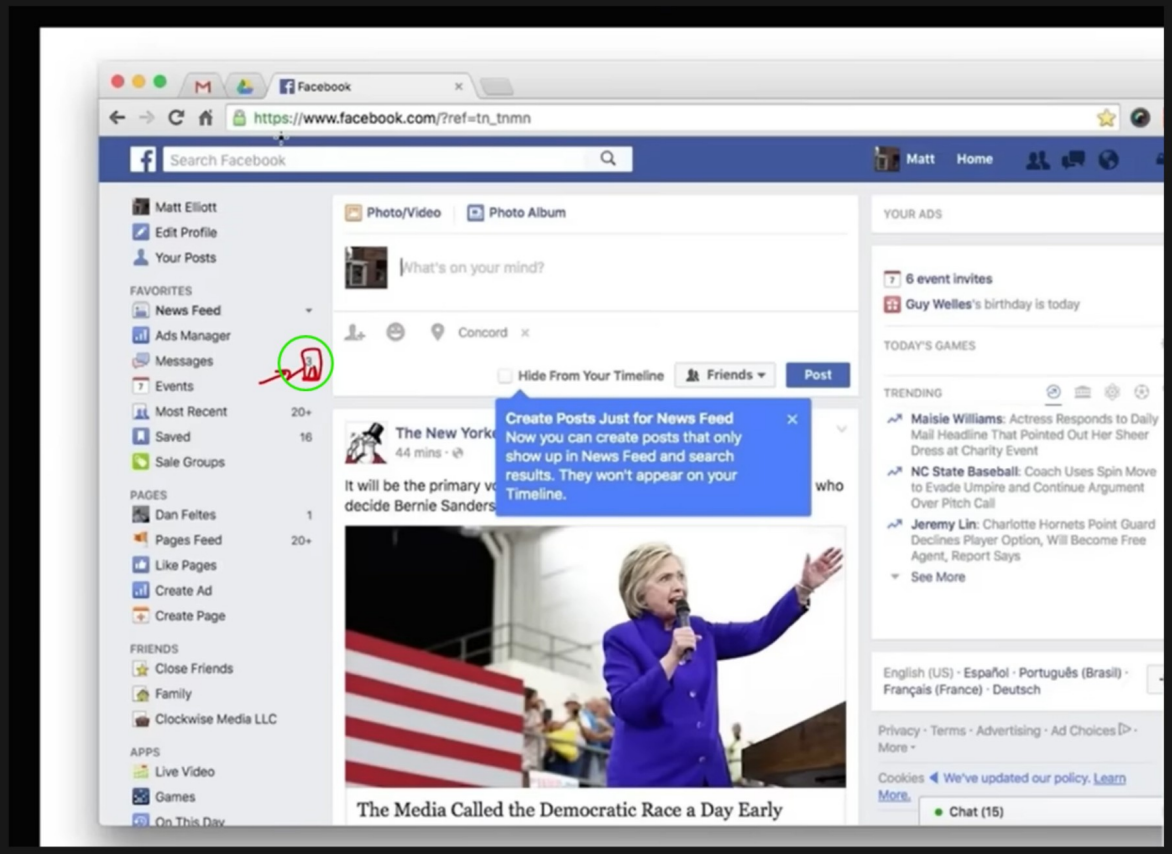

- → Divide the appln in small small features and they developed by component or reusable component and merge to complete appln.
- → Single page appln

what issue resolved by React ?

Before react

— once update in any feature on web page then it's completely refresh the page or reload the page.

— But after react they only reload the updated things.

DOM — Real DOM
DOM — Virtual DOM

Advantages of React

1) Speed & Performance
2) reusable of component
3) Huge community system
4) JSX (Java Script XML = JS + HTML)
5) cross potential platform

which are the concepts required for React from JS :-

1) Fundamentals :- variable declr, data types,
statements - if / else
↳ loops - for/while/ double

#Imp :-
How to run JS program internally ?

e.g. function add (a)
{
—
}
add (10)

Fun^n :-- How to define Fun^n in JS
- call the fun^n

1) Fun^n def^n / declr
2) Fun^n Expression
3) Anonymous Fun^n
4) Arrow Fun^n ✓
5) IIFE

Data Types
1) Numbers
2) Big int
3) String
4) boolean
5) null
6) undefined
7) Symbol
(NaN)

primitive data type

Non primitive datatype
Object
↳ object literals
↳ fun^n
↳ array

break, return, continue statement

2) Array :- declr, initialize, fun^n predefined, map, filter, reduce, forEach

3) object :- declr, element of object, add, freeze, predefined fun^n, destructure the array/ obj element

4) Fun^n - Type :- higher order fun^n, callback fun^n, Scope - lexical scope, local scope block scope

5) ES 6 Feature :- variable declr - let, const
arrow fun^n

6) Asynchronous Prog. → promises, async await, fetch API
setTimeout, setInterval

7) DOM Concept → fun^n - access html element

Extra Topic :- 1) Template literals
2) spread operator
3) JSON data
4) DOM
5) Data Validation

Synchronous Vs Asynchronous

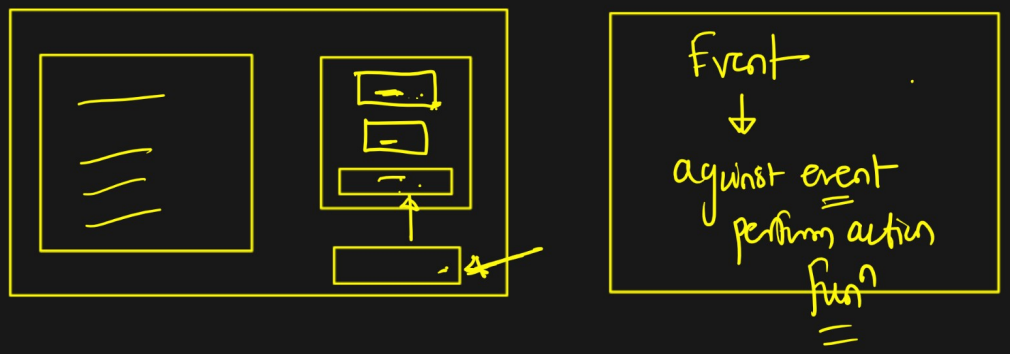

Task 1 ≡ } 1,5 min
Task 2 ≡ } sec

Interview Question on JS :-

How to create HTML Element through JS ?

Requirements Tools
1) Node JS
2) VS Code
code terminal

DOM

Create a html element through React → React / JS code

Library vs Framework :-

Library :- Implement a particular / specific feature { GSAP, Lenis, ReactJS } customization

Framework :- Readymade skeleton to design hole appln

Import & Export :-

Export Types → 1) Name Export
2) Default Export → only one value return from page export
